EML4 fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes EML4 gene fusions from the msk_impact_50k_2026 study, covering 223 fusion events. 196/201 fusions with known frame status (97.5%) were in-frame. 119/223 fusions (53.4%) retained the HELP motif domain. Domain retention was tested with Fisher's exact test (p=0.999931, not statistically significant at alpha=0.05). No literature benchmark is configured for EML4.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 223 analyzed fusion events, identifying 3 distinct fusion partner genes. The most frequent partner was ALK, observed in 221 events.

Domain retention

HELP motif domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 95/196 (48.5%) of in-frame fusions retained the domain, p=0.999931 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 9.9999e-06.

Domain disruption

Domain-disruption analysis was skipped: EML4 has no disruption_required_domains configured; domain-disruption analysis was skipped.

Junction concentration

34% of 182 fusions with this gene as the 5' partner join at exon 13, against 4% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=9.9999e-06, corrected for testing every exon, statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 184 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 223 aa (exon 6/7 boundary; label-permutation p=0.000999001). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is 0 aa from the nearest configured domain boundary at 223 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=97) and "not_retained" (n=87). For Frame_status, retained: 78/82 (95.1%, 95% CI 88.1%-98.1%); not_retained: 84/84

(100.0%, 95% CI 95.6%-100.0%). Welch's t-test comparing Tumor_variant_count between groups gave means of 67.6146 vs 62.3103, p=0.604098 (not statistically significant at alpha=0.05).

Composite evidence score

Composite evidence score reported: domain_disruption sub-score excluded: the supplied result had no applicable p-value (e.g. disruption_required_domains not configured for this gene).

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for EML4 in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (41 row(s) in genomic_bin_recurrence, 2 row(s) in exact_position_recurrence, 7 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: EML4 has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run; see the accompanying data for details.

Mutation cooccurrence

Mutation cooccurrence reported: EML4 has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection produced results for this run (96 row(s) in window_scan, 42 row(s) in top_windows); see the accompanying table.
