ERG fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes ERG gene fusions from the msk_impact_50k_2026 study, covering 788 fusion events. 238/722 fusions with known frame status (33.0%) were in-frame. 757/775 fusions (97.7%) retained the Ets-domain. Domain retention was tested with Fisher's exact test (p=0.778543, not statistically significant at alpha=0.05). No literature benchmark is configured for ERG.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 788 analyzed fusion events, identifying 9 distinct fusion partner genes. The most frequent partner was TMPRSS2, observed in 764 events.

Domain retention

Ets-domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 231/238 (97.1%) of in-frame fusions retained the domain, p=0.778543 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.002997.

Domain disruption

Domain-disruption analysis was skipped: ERG has no disruption_required_domains configured; domain-disruption analysis was skipped.

Junction concentration

88% of 374 fusions with this gene as the 3' partner join at exon 2, against 45% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=9.9999e-06, corrected for testing every exon, statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 684 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 307 aa (exon 9/10 boundary; label-permutation p=0.000999001). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is -3 aa from the nearest configured domain boundary at 310 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=667) and "not_retained" (n=17). For Frame_status, retained: 199/622 (32.0%, 95% CI 28.4%-35.8%); not_retained: 6/13

(46.2%, 95% CI 23.2%-70.9%). Welch's t-test comparing Tumor_variant_count between groups gave means of 50.066 vs 36.4706, p=0.169952 (not statistically significant at alpha=0.05).

Composite evidence score

Composite evidence score reported: domain_disruption sub-score excluded: the supplied result had no applicable p-value (e.g. disruption_required_domains not configured for this gene).

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for ERG in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (148 row(s) in genomic_bin_recurrence, 5 row(s) in exact_position_recurrence, 7 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: ERG has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run; see the accompanying data for details.

Mutation cooccurrence

Mutation cooccurrence reported: ERG has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection produced results for this run (105 row(s) in window_scan, 55 row(s) in top_windows); see the accompanying table.
