

BRAF fusion-hotspot benchmark report

Study: thca_tcga_pan_can_atlas_2018

Abstract

This report analyzes BRAF gene fusions from the thca_tcga_pan_can_atlas_2018 study, covering 15 fusion events. 15/15 fusions (100.0%) were in-frame. 9/15 fusions (60.0%) retained the Protein kinase domain. Domain retention was tested with Fisher's exact test ($p=1$, not statistically significant at $\alpha=0.05$). Compared to the literature benchmark (PMC5461196: 100.0% in-frame, 100.0% domain-retained), this run observed 100.0% in-frame and 60.0% domain retention.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 15 analyzed fusion events, identifying 8 distinct fusion partner genes. The most frequent partner was SND1, observed in 5 events.

Domain retention

Protein kinase domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 9/15 (60.0%) of in-frame fusions retained the domain, $p=1$ (not statistically significant at $\alpha=0.05$). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.015984.

Domain disruption

Disruption of the RAS-binding domain and Cysteine-rich domain was tested with Fisher's exact test comparing in-frame fusions against all others; 10/15 (66.7%) of in-frame fusions disrupted the domain, $p=1$ (not statistically significant at $\alpha=0.05$). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.811419.

Cutpoint detection

Cutpoint detection scanned 15 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 380 aa (exon 8; permutation-corrected $p=0.020979$, statistically significant at $\alpha=0.05$). This is -77 aa from the nearest configured domain boundary at 457 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" ($n=9$) and "not_retained" ($n=6$). For Frame_status, retained: 9/9 (100.0%, 95% CI 70.1%-100.0%); not_retained: 6/6 (100.0%, 95% CI 61.0%-100.0%). Welch's t-test comparing Tumor_variant_count between groups gave means of unavailable vs unavailable, $p=unavailable$.

Composite evidence score

Composite evidence score produced results for this run (8 row(s) in composite_evidence_ranking); see the accompanying table.

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association produced results for this run; see the accompanying data for details.

Joint partner

Joint partner reported: BRAF has no gene_pair configured; joint-partner analysis was skipped.

Mutation cooccurrence

Mutation cooccurrence produced results for this run (1 row(s) in cooccurrence_results); see the accompanying table.

Window detection

Window detection produced results for this run (19 row(s) in window_scan, 6 row(s) in top_windows); see the accompanying table.

domain retention outliers

BRAF domain-retention track

fusion schematic

BRAF fusion-transcript schematic

Fusion order varies by row; follow each row's 5' and 3' labels (BRAF portion is domain-colored, exon ticks). Partner-gene blocks share one color; row labels identify each partner.

Partner-block colors are decorative; row labels identify partners.
