RTEL1 fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes RTEL1 gene fusions from the msk_impact_50k_2026 study, covering 24 fusion events. 5/10 fusions with known frame status (50.0%) were in-frame. 9/24 fusions (37.5%) retained the Helicase C-terminal domain. Domain retention was tested with Fisher's exact test (p=0.116746, not statistically significant at alpha=0.05). No literature benchmark is configured for RTEL1.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 24 analyzed fusion events, identifying 19 distinct fusion partner genes. The most frequent partner was ZGPAT, observed in 4 events.

Domain retention

Helicase C-terminal domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 3/5 (60.0%) of in-frame fusions retained the domain, p=0.116746 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.0609391.

Domain disruption

Disruption of the DEAD_2 was tested with Fisher's exact test comparing in-frame fusions against all others; 1/4 (25.0%) of in-frame fusions disrupted the domain, p=0.990431 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.970297.

Junction concentration

17% of 12 fusions with this gene as the 3' partner join at exon 26, against 1% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=0.0599401, corrected for testing every exon, not statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 22 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 357 aa (exon 13; label-permutation p=0.653347). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is 85 aa from the nearest configured domain boundary at 272 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=8) and "not_retained" (n=14). For Frame_status, retained: 3/4 (75.0%, 95% CI 30.1%-95.4%); not_retained: 1/5 (20.0%, 95% CI 3.6%-62.4%). Welch's t-test comparing Tumor_variant_count between groups gave means of 32.25 vs 40.2857, p=0.696709 (not statistically significant at alpha=0.05).

Composite evidence score

Composite evidence score reported: cutpoint_proximity sub-score excluded: corrected cutpoint p-value was missing or >= 0.05, cutpoint was not determinable, or mapped breakpoints were unavailable.

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for RTEL1 in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (13 row(s) in genomic_bin_recurrence, 0 row(s) in exact_position_recurrence, 2 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: RTEL1 has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run; see the accompanying data for details.

Mutation cooccurrence

Mutation cooccurrence reported: RTEL1 has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection produced results for this run (38 row(s) in window_scan, 22 row(s) in top_windows); see the accompanying table.

Figures

domain retention outliers

fusion schematic

Partner-block colors are decorative; row labels identify partners.

intragenic deletion schematic

RTEL1 intragenic-deletion schematic

retained N-terminal block → deleted span (plain connector) → resumed C-terminal block
