

NTRK1 fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes NTRK1 gene fusions from the msk_impact_50k_2026 study, covering 78 fusion events. 32/78 fusions (41.0%) were in-frame. 64/78 fusions (82.1%) retained the Protein kinase domain. Domain retention was tested with Fisher's exact test ($p=0.0482628$, statistically significant at $\alpha=0.05$). No literature benchmark is configured for NTRK1.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 78 analyzed fusion events, identifying 43 distinct fusion partner genes. The most frequent partner was LMNA, observed in 12 events.

Domain retention

Protein kinase domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 30/32 (93.8%) of in-frame fusions retained the domain, $p=0.0482628$ (statistically significant at $\alpha=0.05$). The Protein kinase domain appears to be required for retention. A breakpoint-position permutation test produced a corroborating empirical p-value of 0.000999001.

Domain disruption

Domain disruption was tested with Fisher's exact test comparing in-frame fusions against all others; 31/32 (96.9%) of in-frame fusions disrupted the domain, $p=0.0744325$ (not statistically significant at $\alpha=0.05$). A breakpoint-position permutation test produced a corroborating empirical p-value of 0.639636.

Cutpoint detection

Cutpoint detection scanned 76 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 501 aa (permutation-corrected $p=0.014985$, statistically significant at $\alpha=0.05$). This is -11 aa from the nearest configured domain boundary at 512 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" ($n=64$) and "not_retained" ($n=12$). For Frame_status, retained: 30/36 (83.3%, 95% CI 68.1%-92.1%); not_retained: 2/8 (25.0%, 95% CI 7.1%-59.1%). Welch's t-test comparing Tumor_variant_count between groups gave means of 66.3594 vs 43.25, $p=0.200314$ (not statistically significant at $\alpha=0.05$).

Composite evidence score

Composite evidence score produced results for this run (43 row(s) in composite_evidence_ranking); see the accompanying table.

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Joint partner

Joint partner reported: NTRK1 has no gene_pair configured; joint-partner analysis was skipped.
