KIF5B fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes KIF5B gene fusions from the msk_impact_50k_2026 study, covering 96 fusion events. 85/87 fusions with known frame status (97.7%) were in-frame. 93/96 fusions (96.9%) retained the Kinesin motor domain. Domain retention was tested with Fisher's exact test (p=0.307781, not statistically significant at alpha=0.05). No literature benchmark is configured for KIF5B.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 96 analyzed fusion events, identifying 5 distinct fusion partner genes. The most frequent partner was RET, observed in 87 events.

Domain retention

Kinesin motor domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 83/85 (97.6%) of in-frame fusions retained the domain, p=0.307781 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 9.9999e-06.

Domain disruption

Domain-disruption analysis was skipped: KIF5B has no disruption_required_domains configured; domain-disruption analysis was skipped.

Junction concentration

74% of 76 fusions with this gene as the 5' partner join at exon 15, against 12% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=9.9999e-06, corrected for testing every exon, statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 79 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 575 aa (exon 15; label-permutation p=0.022977). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is 250 aa from the nearest configured domain boundary at 325 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=76) and "not_retained" (n=3). For Frame_status, retained: 68/69 (98.6%, 95% CI 92.2%-99.7%); not_retained: 2/3

(66.7%, 95% CI 20.8%-93.9%). Welch's t-test comparing Tumor_variant_count between groups gave means of 53.7895 vs 43.3333, p=0.455031 (not statistically significant at alpha=0.05).

Composite evidence score

Composite evidence score reported: domain_disruption sub-score excluded: the supplied result had no applicable p-value (e.g. disruption_required_domains not configured for this gene).

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for KIF5B in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (12 row(s) in genomic_bin_recurrence, 1 row(s) in exact_position_recurrence, 4 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: KIF5B has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run; see the accompanying data for details.

Mutation cooccurrence

Mutation cooccurrence reported: KIF5B has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection produced results for this run (58 row(s) in window_scan, 23 row(s) in top_windows); see the accompanying table.
