PRKACA fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes PRKACA gene fusions from the msk_impact_50k_2026 study, covering 35 fusion events. 24/25 fusions with known frame status (96.0%) were in-frame. 29/30 fusions (96.7%) retained the Protein kinase domain. Domain retention was tested with Fisher's exact test (p=0.214286, not statistically significant at alpha=0.05). No literature benchmark is configured for PRKACA.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 35 analyzed fusion events, identifying 2 distinct fusion partner genes. The most frequent partner was DNAJB1, observed in 34 events.

Domain retention

Protein kinase domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 24/24 (100.0%) of in-frame fusions retained the domain, p=0.214286 (not statistically significant at alpha=0.05). A breakpoint-position permutation test produced a corroborating empirical p-value of 9.9999e-06.

Domain disruption

Domain-disruption analysis was skipped: PRKACA has no disruption_required_domains configured; domain-disruption analysis was skipped.

Junction concentration

100% of 27 fusions with this gene as the 3' partner join at exon 2, against 39% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=9.9999e-06, corrected for testing every exon, statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 28 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 16 aa (exon 1/2 boundary; label-permutation p=0.038961). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is -29 aa from the nearest configured domain boundary at 45 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=27) and "not_retained" (n=1). For Frame_status, retained: 22/22 (100.0%, 95% CI 85.1%-100.0%); not_retained: 0/1

(0.0%, 95% CI 0.0%-79.3%). Welch's t-test comparing Tumor_variant_count between groups gave means of 26.7037 vs 61, p=unavailable.

Composite evidence score

Composite evidence score reported: domain_disruption sub-score excluded: the supplied result had no applicable p-value (e.g. disruption_required_domains not configured for this gene).

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for PRKACA in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (11 row(s) in genomic_bin_recurrence, 0 row(s) in exact_position_recurrence, 1 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: PRKACA has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run; see the accompanying data for details.

Mutation cooccurrence

Mutation cooccurrence reported: PRKACA has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection reported: no candidate window of the configured widths (25, 50, 100, 200) met the minimum-event-count guard (min_events_per_window=4) on both sides of the split
