RET fusion-hotspot benchmark report

Study: msk_impact_50k_2026

Abstract

This report analyzes RET gene fusions from the msk_impact_50k_2026 study, covering 194 fusion events. 146/171 fusions with known frame status (85.4%) were in-frame. 179/194 fusions (92.3%) retained the Protein kinase domain. Domain retention was tested with Fisher's exact test (p=0.00256613, statistically significant at alpha=0.05). Compared to the literature benchmark (PMCID: PMC6430196 (KIF5B-RET): 100.0% in-frame, 100.0% domain-retained), this run observed 85.4% in-frame and 92.3% domain retention.

Results summary

Fusion partner frequency

Fusion-partner frequency was tabulated across 194 analyzed fusion events, identifying 33 distinct fusion partner genes. The most frequent partner was KIF5B, observed in 87 events.

Domain retention

Protein kinase domain retention was tested with Fisher's exact test comparing in-frame fusions against all others; 141/146 (96.6%) of in-frame fusions retained the domain, p=0.00256613 (statistically significant at alpha=0.05). The Protein kinase domain appears to be required for retention. A breakpoint-position permutation test produced a corroborating empirical p-value of 0.000999001.

Domain disruption

Disruption of the Cadherin domain was tested with Fisher's exact test comparing in-frame fusions against all others; 111/116 (95.7%) of in-frame fusions disrupted the domain, p=0.00534494 (statistically significant at alpha=0.05). The Cadherin domain appears to require loss or disruption rather than retention. A breakpoint-position permutation test produced a corroborating empirical p-value of 0.000999001.

Junction concentration

90% of 143 fusions with this gene as the 3' partner join at exon 12, against 4% expected if breakpoints fell at random along the gene; this is the most over-represented junction (empirical p=0.000999001, corrected for testing every exon, statistically significant at alpha=0.05). The random-breakage null assumes a breakpoint anywhere in the gene would be detected. Capture panels such as MSK-IMPACT tile only selected introns, so concentration on panel data is partly by assay design and this p-value overstates the evidence for biological concentration. Confirm in a cohort sequenced without intron selection (whole genome or RNA).

Cutpoint detection

Cutpoint detection scanned 157 mapped breakpoints for the protein position that best separates domain-retained from lost/disrupted fusions; the inferred cutpoint was position 712 aa (exon 11; label-permutation p=0.000999001). This boundary is descriptive: retained/lost status follows from breakpoint position, so a clean split exists by construction and the p-value is not evidence of selection. This is -12 aa from the nearest configured domain boundary at 724 aa.

Corroborating confidence statistics

Corroborating confidence statistics compared Domain_retention_flags groups "retained" (n=145) and "not_retained" (n=12). For Frame_status, retained: 112/128 (87.5%, 95% CI 80.7%-92.2%); not_retained: 4/11 (36.4%, 95% CI 15.2%-64.6%). Welch's t-test comparing Tumor_variant_count between groups gave means of 61.4276 vs 36.75, p=0.0186911 (statistically significant at alpha=0.05).

Composite evidence score

Composite evidence score produced results for this run (33 row(s) in composite_evidence_ranking); see the accompanying table.

Exon retention

Exon retention produced results for this run (1 row(s) in Exon_retention); see the accompanying table.

Expression association

Expression association reported: No mRNA expression data was available for RET in this cohort; expression-association analysis was skipped.

Genomic position recurrence

Genomic position recurrence produced results for this run (10 row(s) in genomic_bin_recurrence, 2 row(s) in exact_position_recurrence, 5 row(s) in protein_position_genomic_spread); see the accompanying table.

Joint partner

Joint partner reported: RET has no gene_pair configured; joint-partner analysis was skipped.

Mechanistic interpretation

Mechanistic interpretation produced results for this run (4 row(s) in retention_counter_intuitive_events, 2 row(s) in retention_counter_intuitive_recurrent_partners, 5 row(s) in disruption_counter_intuitive_events, 2 row(s) in disruption_counter_intuitive_recurrent_partners); see the accompanying table.

Mutation cooccurrence

Mutation cooccurrence reported: RET has no mutual_exclusivity_targets configured; co-occurrence/mutual-exclusivity analysis was skipped.

Window detection

Window detection produced results for this run (93 row(s) in window_scan, 51 row(s) in top_windows); see the accompanying table.

Figures

domain retention outliers

fusion schematic

Partner-block colors are decorative; row labels identify partners.

Showing the top 28 of 45 partner/breakpoint groups by recurrence; see results.tsv for the complete list.
