

Genome-wide fusion-hotspot analysis of msk_impact_50k_2026

Abstract

This manuscript synthesizes a genome-wide fusion-hotspot cohort scan of msk_impact_50k_2026: 3919 genes carried at least one structural-variant record in the cohort, of which 544 passed the ≥ 5 -distinct-patient recurrence gate. All 544 gated genes were attempted: 4 using hand-curated gene configs and 520 auto-configured, with 20 gated-in gene(s) left unresolvable; 523 of the 544 attempted genes were successfully analyzed with the full registered algorithm suite. 4 genes reached genome-wide Benjamini-Hochberg FDR significance ($q < 0.05$): NTRK3 (58 events, 94.8% in-frame, 94.8% domain-retained, Fisher $p=0.0695489$, $q=8.1653e-09$); ROS1 (122 events, 59.0% in-frame, 87.7% domain-retained, Fisher $p=0.214047$, $q=0.000221281$); ETV6 (90 events, 71.1% in-frame, 75.6% domain-retained, Fisher $p=5.12326e-06$, $q=0.00233279$); FLI1 (118 events, 61.9% in-frame, 5.9% domain-retained, Fisher $p=0.988837$, $q=0.00820622$). 15 additional genes form a highly ranked non-FDR-significant tier flagged for targeted follow-up (see Honorable mentions, below).

Methods

Structural-variant records were retrieved from the msk_impact_50k_2026 cBioPortal study and gated to genes with at least 5 distinct patient(s) carrying a structural-variant record (544 of 3919 genes passed the gate). All 544 gated genes were attempted: 4 using hand-curated gene configs and 520 auto-configured from Genome Nexus canonical-transcript/Pfam-domain data, with 20 gated-in gene(s) left unresolvable; 523 of the 544 attempted genes were successfully analyzed. Each successfully analyzed gene was run through the algorithm suite recorded for this scan (composite_score, confidence_stats, cutpoint_detection, domain_disruption, domain_retention, exon_retention, frequency, joint_partner). Domain-retention and domain-disruption significance were assessed per gene with Fisher's exact test and a breakpoint-position permutation test; the resulting p-values across the 359 genes that produced at least one computable p-value were jointly corrected with Benjamini-Hochberg false-discovery-rate correction at $q < 0.05$.

Results

Genome-wide summary

Genome-wide summary of 359 scanned genes with an FDR-adjusted q-value, ranked left-to-right by composite evidence score; the dashed line marks the $q=0.05$ significance threshold, with 4 genes above it.

Genome-wide fusion-hotspot summary: FDR significance vs. composite evidence rank

FDR-significant and honorable-mention genes

Gene	Tier	N events	In-frame%	Domain-ret.%	Fisher p	Best q

Gene highlights

NTRK3 (FDR-significant)

NTRK3 was analyzed across 58 fusion events, 94.8% in-frame and 94.8% domain-retained. Domain-retention Fisher's exact test on NTRK3's own fusion events alone gives $p=0.0695489$ (not statistically significant at $\alpha=0.05$). Among 359 genes scanned genome-wide in this cohort run, NTRK3's Benjamini-Hochberg-adjusted $q=8.1653e-09$ (reaches genome-wide FDR significance).

Reused from the NTRK3 individual gene report (*fusion_schematic.svg*).

NTRK3 fusion-transcript schematic

partner block → breakpoint → retained NTRK3 portion (domain-colored, exon ticks)

Full per-gene detail: *gene_reports/ntrk3/report.md*

ROS1 (FDR-significant)

ROS1 was analyzed across 122 fusion events, 59.0% in-frame and 87.7% domain-retained. Domain-retention Fisher's exact test on ROS1's own fusion events alone gives $p=0.214047$ (not statistically significant at $\alpha=0.05$). Among 359 genes scanned genome-wide in this cohort run, ROS1's Benjamini-Hochberg-adjusted $q=0.000221281$ (reaches genome-wide FDR significance).

Reused from the ROS1 individual gene report (*fusion_schematic.svg*).

ROS1 fusion-transcript schematic

partner block → breakpoint → retained ROS1 portion (domain-colored, exon ticks)

Full per-gene detail: [gene_reports/ros1/report.md](#)

ETV6 (FDR-significant)

ETV6 was analyzed across 90 fusion events, 71.1% in-frame and 75.6% domain-retained. Domain-retention Fisher's exact test on ETV6's own fusion events alone gives $p=5.12326e-06$ (statistically significant at $\alpha=0.05$). The Sterile alpha motif (SAM)/Pointed domain appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, ETV6's Benjamini-Hochberg-adjusted $q=0.00233279$ (reaches genome-wide FDR significance).

Reused from the ETV6 individual gene report ([fusion_schematic.svg](#)).

ETV6 fusion-transcript schematic

partner block → breakpoint → retained ETV6 portion (domain-colored, exon ticks)

Full per-gene detail: [gene_reports/etv6/report.md](#)

FLI1 (FDR-significant)

FLI1 was analyzed across 118 fusion events, 61.9% in-frame and 5.9% domain-retained. Domain-retention Fisher's exact test on FLI1's own fusion events alone gives $p=0.988837$ (not statistically significant at $\alpha=0.05$). Among 359 genes scanned genome-wide in this cohort run, FLI1's Benjamini-Hochberg-adjusted $q=0.00820622$ (reaches genome-wide FDR significance).

Reused from the FLI1 individual gene report ([fusion_schematic.svg](#)).

FLI1 fusion-transcript schematic

partner block → breakpoint → retained FLI1 portion (domain-colored, exon ticks)

Full per-gene detail: gene_reports/fli1/report.md

RET (Honorable mention, Curated gene config)

RET was analyzed across 194 fusion events, 75.3% in-frame and 92.3% domain-retained. Domain-retention Fisher's exact test on RET's own fusion events alone gives $p=0.000419666$ (statistically significant at $\alpha=0.05$). The Protein kinase domain appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, RET's Benjamini-Hochberg-adjusted $q=0.096687$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the RET individual gene report (fusion_schematic.svg).

RET fusion-transcript schematic

partner block → breakpoint → retained RET portion (domain-colored, exon ticks)

Full per-gene detail: gene_reports/ret/report.md

FGFR2 (Honorable mention)

FGFR2 was analyzed across 136 fusion events, 79.4% in-frame and 84.6% domain-retained. Domain-retention Fisher's exact test on FGFR2's own fusion events alone gives $p=0.000424687$ (statistically significant at $\alpha=0.05$). The Protein tyrosine and serine/threonine kinase appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, FGFR2's Benjamini-Hochberg-adjusted $q=0.096687$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the FGFR2 individual gene report (fusion_schematic.svg).

FGFR2 fusion-transcript schematic

partner block → breakpoint → retained FGFR2 portion (domain-colored, exon ticks)

ALK (Honorable mention, Curated gene config)

ALK was analyzed across 272 fusion events, 83.1% in-frame and 96.0% domain-retained. Domain-retention Fisher's exact test on ALK's own fusion events alone gives $p=0.00191661$ (statistically significant at $\alpha=0.05$). The Protein kinase domain appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, ALK's Benjamini-Hochberg-adjusted $q=0.208073$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the ALK individual gene report (fusion_schematic.svg).

ALK fusion-transcript schematic

partner block → breakpoint → retained ALK portion (domain-colored, exon ticks)

Full per-gene detail: gene_reports/alk/report.md

EGFR (Honorable mention)

EGFR was analyzed across 55 fusion events, 50.9% in-frame and 74.5% domain-retained. Domain-retention Fisher's exact test on EGFR's own fusion events alone gives $p=0.0114539$ (statistically significant at $\alpha=0.05$). The Protein tyrosine and serine/threonine kinase appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, EGFR's Benjamini-Hochberg-adjusted $q=0.233522$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the EGFR individual gene report (fusion_schematic.svg).

BRAF (Honorable mention, Curated gene config)

BRAF was analyzed across 179 fusion events, 84.4% in-frame and 91.1% domain-retained. Domain-retention Fisher's exact test on BRAF's own fusion events alone gives $p=0.0133676$ (statistically significant at $\alpha=0.05$). The Protein kinase domain appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, BRAF's Benjamini-Hochberg-adjusted $q=0.264639$ (does not reach genome-wide FDR significance). The RAS-binding domain and Cysteine-rich domain appear to require loss or disruption rather than retention. Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the BRAF individual gene report (fusion_schematic.svg).

FGFR3 (Honorable mention)

FGFR3 was analyzed across 152 fusion events, 48.7% in-frame and 93.4% domain-retained. Domain-retention Fisher's exact test on FGFR3's own fusion events alone gives $p=0.0194824$ (statistically significant at $\alpha=0.05$). The Protein tyrosine and serine/threonine kinase appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, FGFR3's Benjamini-Hochberg-adjusted $q=0.208073$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

CDKN2B (Honorable mention)

CDKN2B was analyzed across 12 fusion events, 16.7% in-frame and 16.7% domain-retained. Domain-retention Fisher's exact test on CDKN2B's own fusion events alone gives $p=0.0222222$ (statistically significant at $\alpha=0.05$). Among 359 genes scanned genome-wide in this cohort run, CDKN2B's Benjamini-Hochberg-adjusted $q=0.208073$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

TMPRSS2 (Honorable mention)

TMPRSS2 was analyzed across 867 fusion events, 30.0% in-frame and 6.1% domain-retained. Domain-retention Fisher's exact test on TMPRSS2's own fusion events alone gives $p=0.0292045$ (statistically significant at $\alpha=0.05$). The Trypsin appears to be required for retention. Among 359 genes scanned

genome-wide in this cohort run, TMPRSS2's Benjamini-Hochberg-adjusted $q=0.208073$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Reused from the TMPRSS2 individual gene report (*fusion_schematic.svg*).

NTRK1 (Honorable mention, Curated gene config)

NTRK1 was analyzed across 78 fusion events, 41.0% in-frame and 82.1% domain-retained. Domain-retention Fisher's exact test on NTRK1's own fusion events alone gives $p=0.0482628$ (statistically significant at $\alpha=0.05$). The Protein kinase domain appears to be required for retention. Among 359 genes scanned genome-wide in this cohort run, NTRK1's Benjamini-Hochberg-adjusted $q=0.208073$ (does not reach genome-wide FDR significance). Did not survive genome-wide multiple-testing correction (FDR-adjusted q -value at or above the significance threshold), but ranks highly by raw p -value among the non-FDR-significant genes and may warrant targeted follow-up. This is NOT a claim of statistical significance.

Full per-gene detail: gene_reports/fh/report.md

Discussion

- Cross-gene Benjamini-Hochberg FDR correction was applied jointly across the 359 genes that produced at least one computable p -value in this scan. This reduces false-positive findings relative to testing each gene in

isolation, but is a conservative correction: a real per-gene effect can fail to reach the $q < 0.05$ threshold once corrected across that full p-value-bearing gene set.

- 4 gene(s) used hand-curated gene configurations, while 520 gene(s) were auto-configured from Genome Nexus canonical-transcript/Pfam-domain data using a kinase/catalytic-keyword heuristic to select the tracked domain; auto-configured domains have not been manually verified the way hand-curated ones have.
- Data were retrieved live from the public msk_impact_50k_2026 cBioPortal study as of 2026-09-04T19:24:30.753442+00:00. Some cBioPortal cohorts (e.g. actively accruing clinical-sequencing panels such as MSK-IMPACT) are updated periodically, so exact counts could shift if this scan is re-run later against such a cohort.
- All findings in this manuscript are computational, hypothesis-generating candidate evidence from bioinformatic analysis of public cohort data, not validated clinical calls; a gene's presence here is not a therapeutic or diagnostic recommendation.
